SYSTEM AND METHOD FOR
COMMUNICATING DATA

Abstract Of The Disclosure

A system and method is provided for
5   communicating data between a source application process
and one or more destination application processes.
This system and method performs conversion and routing
functions which require only a single conversion of all
inbound and outbound transmissions regardless of the
10 variety of destinations/sources. The functions also
enable changes, additions, and deletions of
source/destination application processes to be made
without modification of the source/destination
application processes and without taking a process off-
15 line. These conversion and routing functions are
performed by receiving data in a source format,
converting the data to a standard format, identifying
one or more destinations in a database using a
transaction type, transmitting a copy of the data to
20 each destination, and converting the data to a
destination format.
